

Costs, Efficiency and Economies of Scale and Scope in Higher Education Institutions

1 September 2016

Geraint Johnes

Jill Johnes

TRIPLE-ACCREDITED, WORLD-RANKED

Baumol (1982) - multiproduct organisations, economies of scale and scope.

Cohn (1989) applied this to the context of higher education institutions.

Aigner (1977) introduced stochastic frontier analysis.

Lazarsfeld (1968) introduced latent class modelling.

Multiproduct organisations

Quadratic cost function

$$C_k = \alpha_0 + \sum_i \beta_i y_{ik} + \frac{1}{2} \sum_i \sum_j \gamma_{ij} y_{ik} y_{jk} + \sum_l \delta_l w_{lk} + \varepsilon_k$$

Average Incremental Cost: $AIC(y_i) = [C(y_n) - C(y_{n-i})]/y_i$

Ray economies of scale: $S_R = \frac{C(y)}{\sum_i y_i C_i(y)}$

Product-specific economies of scale: $S_i(y) = AIC(y_i)/C_i(y)$

Economies of scope: $S_G = \left[\sum_i C(y_i) - C(y) \right] / C(y)$

Stochastic frontier

$$C_k = \alpha_0 + \sum_i \gamma_{ik} + \frac{1}{2} \sum_i \sum_j \gamma_{ij} \gamma_{ik} \gamma_{jk} + \sum_l \delta_l w_{lk} + v_k + u_k$$

v is the normal residual

u is a one-sided residual (half-normal) designed to capture observation-specific inefficiency

Estimated by maximum likelihood.

The observation-specific u terms can be retrieved using the method of Jondrow *et al.* (1982).

Lancaster University
Management School

Latent class

$$C_{k,m} = \alpha_{0,m} + \sum_i \beta_{i,m} y_{ik} + \frac{1}{2} \sum_i \sum_j \gamma_{ij,m} y_{ik} y_{jk} + \sum_l \delta_{l,m} w_{lk} + v_{k,m} + u_{k,m}$$

Separate equation estimated for each latent class m , with observations grouped into latent classes by maximum likelihood.

Data

HESA data, institutions in England, 2013-14. Excluding small institutions & Oxbridge.

Costs data include current expenditures, excluding 'hotel' costs.

Student data are full-time equivalent. For undergraduates, broad subject area (science v non-science) is identified. Finer disaggregation results in multicollinearity.

Research is measured by research income. This gives a 'market value' of research, appropriately weighting quantity and quality. It is highly correlated with REF income, and also with bibliometric measures.

Input prices are measured by hedonic wages. These are in turn evaluated as the residual from a regression of wage bill against staff numbers in each of ten age groups.

Controls considered but not used: real estate area comprising listed buildings; income from intellectual property; student numbers from disadvantaged postcodes.

Efficiencies

TRIPLE-ACCREDITED, WORLD-RANKED

Lancaster University
Management School

Conclusions

Latent class approach picks up unobserved heterogeneity.

PG provision is costly – especially so in Russell Group and specialist institutions (LC2).

There are unexhausted product-specific economies of scale in institutions in LC2.

There are unexhausted economies of scope in LC1.

There are high levels of efficiency.
