

“Once Highly Productive, Always Highly Productive”? Research Productivity from a Life-Cycle Perspective,

2 June 2022

00:45:10 Simon Marginson: Time to come forward with questions and statements for the Q&A part of the webinar! Put them in the Chat!

00:52:33 Yusuf İkbal Oldaç: Prestige normalised journal productivity is an interesting metric. Did you calculate this yourself with your team? Or is this already provided by scopus?

00:53:39 Ian McNay: I have two questions. In joint publications do highly productive staff work with others who are high productive? I will send the second separately

00:55:00 Ian McNay: There appear to be significant minorities who are not promoted despite high productivity and contrariwise low producers who make it to full prof. Have you hypotheses for what the other promotion factors are?

01:02:34 Marta Kozłowska: Thank you for your interesting presentation. You've mentioned that for the Polish cohort neither age or gender seem to matter. (Sorry I couldn't see the data on slide 25 clearly) How about the OECD countries - can you see any trends already emerging there?

01:09:47 Yusuf İkbal Oldaç: Thank you for this informative presentation. All findings are interesting. But I think at the end of the day, the question of “what do academics do?” should also come to the fore. the impretive to “publish publish publish” has not always been there, although it has become so important these days that we started thinking this was always the case. It may be good to remind ourselves that there are other valuable work academics do too.

01:10:35 Marta Kozłowska: Thank you - a very interesting answer.

01:10:50 Gad Yair: Thanks for the presentation and great discussion!!!

01:11:04 Yusuf İkbal Oldaç: Please don't get me wrong though. I enjoyed the presentation!
😊

01:12:24 Giorgi Tavadze: Thanks!

01:12:31 Mayra Morales Tirado: let's no forget organisational, funding structures, training or mentorship systems. If we look at scientific careers without enough contextualisation, policy makers and decision makers at universities may simply take it as... productivity being responsibility of the individual researcher only, ignoring the conditions that enable productivity

01:15:17 Marta Kozłowska: @ Mayra: Indeed - thank you for bringing these factors up here.

01:17:35 Marta Kozłowska: Thank you very much for today.
